

RCA Report – Website Downtime (QIB Production)

Incident Date: 23-Apr-2026

Incident Time: 06:53:19 – 07:09:58 PM IST (16 Mins 39 Sec Downtime)

The screenshot shows the Site24x7 Outages dashboard. At the top, there are filters for Resource Type (Monitor), Resource (QIB-PROD-Website), Time Period (Custom Period), Date Range (23-04-2026 12:00 AM to 05-05-2026 10:43 AM), and Status (Down). Below these filters, a table lists the outage details:

Monitor Name	End Time	Duration	Reason	Latest Comment
QIB-PROD-Website	Thu, Apr 23, 2026 6:53:19 PM	16 Mins 39 Secs	The response could not be received within 30 seconds from the mb.qibukplc.com, resulting in incomplete or partial response. This will lead to errors in content checks as the response wont be received completely. The response could not be received within 30 seconds from the mb.qibukplc.com, resulting in incomplete or partial response. This will lead to errors in content checks as the response wont be received completely.	

Incident Summary

Application URL: mb.qibukplc.com

Monitoring Tool: Site24x7

Duration: ~16 minutes 39 sec

The screenshot shows the Savvy Time World Clock interface. It displays the current time for two locations: London, United Kingdom (BST) and Mumbai, India (IST). The time for London is 2:23 pm, and the time for Mumbai is 6:53 pm. Both times are for Tuesday, May 5, 2026. The interface includes a search bar to add more time zones and a 'Discover more' link at the bottom.

UK (Server Time - GMT): 14:23 to 14:39

India (IST): 18:53 to 19:09

Observations

- Issue observed across multiple monitoring locations
- Azure infrastructure metrics (CPU, Memory, Disk) were normal
- No infrastructure-level bottleneck identified

Apache error log entry:

[Thu Apr 23 14:22:29 2026] AH00326: Server ran out of threads to serve requests

This corresponds to 18:52 IST, matching monitoring alert at 18:53 IST.

Root Cause

Apache server exhausted its worker threads, causing request queuing and timeouts. The observed timeout behaviour was not caused by server resource exhaustion or infrastructure failure.

After Log analysis confirms that Apache HTTP Server (mpm_winnt module) reached its configured thread limit (64 worker threads), as indicated by error AH00326. Once all threads were occupied, Apache was unable to accept or process additional incoming requests, leading to request queuing and eventual client-side timeouts. This is a known Apache configuration limitation and not a server-level issue.

Impact

- Website unresponsive for ~16 minutes
- User requests delayed or dropped
- Monitoring alerts triggered

Resolution

Apache service restart cleared threads and restored normal operations.

Preventive Actions

- Increase Apache thread limits (ThreadsPerChild, MaxRequestWorkers)
- Review long-running requests with development team
- Implement monitoring for thread usage
- Optimize backend performance
